FIELD GUIDE / TESTNET

Getting testnet HYPE on Elysium

The route that worked for a brand-new wallet after every official faucet said no. Each step has the exact click path, the on-chain check, and the mistakes to avoid.

OVERVIEW

Contents

1	Summary and result	why this route, what it cost
2	What does not work	faucets we tried
3	The route at a glance	diagram and timeline
4	Before you start	wallet, networks, addresses
5	Steps 1 to 3: mainnet, account, drip	activate HyperCore, claim 1,000 USDC
6	Steps 4 to 5: buy HYPE and move it	spot market, Core to EVM
7	Steps 6 to 7: bridge and fund the deployer	Elysium testnet
8	Pitfalls and troubleshooting	every mistake we hit
9	Final state, safety, glossary	and API cheat sheet

HOW TO READ THIS GUIDE

Do the steps in order with **one wallet**. After every step run the check listed under it. If a check does not show the expected value, stop and fix that step before moving on. Replace `YOUR_WALLET` with your own address and `DEPLOYER` with the wallet that will deploy.

1

Summary and result

Elysium testnet charges gas in HYPE. The official faucets reject a new wallet, so a fresh wallet cannot deploy anything. This guide gets testnet HYPE a different way: it uses a few dollars of real HYPE to activate a Hyperliquid account, which unlocks a testnet drip of 1,000 mock USDC, which is then traded for testnet HYPE and bridged into Elysium.

~ 0.05 HYPE
mainnet HYPE spent (about $4 at $78)

~ 2 hours
of clicking, mostly waiting on confirmations

0.2341 HYPE
testnet HYPE that arrived on Elysium

~ 16 deploys
of headroom (one deploy is about 0.0126 HYPE)

Why the usual routes fail

Every free route asks something a brand-new wallet cannot show: an old HYPE balance, an ETH history, or an account with activity. The route here replaces that with a small, real deposit, which proves the wallet is real to Hyperliquid and costs about the price of a coffee.

> **SCOPE**
> This is for **testnet** HYPE only. Testnet tokens have no value. The testnet HYPE/USDC market is thin and not priced like real HYPE, so nothing here says what real HYPE is worth.

2

What does not work

We tried all of these first. Skip them.

Route	Why it fails for a new wallet
Elysium faucet testnet.elysium.kinetiq.xyz/faucet	Returns `unfunded` with the message "try an address with a balance on HyperEVM or Hyperliquid mainnet", even for a wallet holding 0.1 HYPE on HyperEVM mainnet. The wallet's HYPE was new.
Quicknode (Hyperliquid and Elysium)	Requires a small mainnet balance held for **at least 3 days**.
Chainstack faucet	Requires **0.08 ETH** on Ethereum mainnet plus ETH history.
Gas.zip faucet	Requires about 0.01 ETH and 5 or more transactions in 30 days.
ZalalenA faucet	Works with a captcha, but pays **0.0001 HYPE** per claim. One deploy needs about 0.0126, so around 13 days of claims.
Alchemy faucet	The wallet passed the check, but the faucet itself showed "Insufficient faucet balance".

Route	Why it fails for a new wallet
Circle faucet, then buy HYPE	Circle pays 20 USDC per claim every 2 hours. The testnet HYPE/USDC market has a minimum order of 0.01 HYPE (about $40 to $70 here), so it takes many claims. Possible but slow.
Orderly faucet (1,000 USDC)	Not tried. It issues Orderly's own test USDC, so it very likely cannot be deposited into Hyperliquid.
Sending HYPE to 0x2222…2222 on its own	Does not create the HyperCore account. The HYPE sits in escrow and the role stays `missing` until the account is activated (see step 2).

3

The route at a glance

Timeline of the real run

Stage	What happened	Time
Steps 1 and 2	Swap, approve, deposit. Account role changed from `missing` to `user`; spot showed 2.0 USDC and the escrowed 0.01 HYPE was released.	~ 15 min
Step 3	Drip arrived within a minute of opening the page after activation.	~ 2 min
Step 4	First limit order sat unfilled because the cheap ask was taken; a second limit at a higher ceiling filled. Then a second buy used the rest of the USDC.	~ 20 min
Steps 5 and 6	Core to EVM was instant. The bridge credited Elysium in about one minute.	~ 5 min

4

Before you start

What you need

- A browser wallet such as Rabby, with **HyperEVM mainnet**, **HyperEVM testnet** and **Elysium testnet** added.
- At least **0.06 HYPE** (about $5) on **HyperEVM mainnet** in `YOUR_WALLET`. About 0.04 is swapped; the rest is gas.
- Optional but useful: Foundry's `cast` for the check commands. Every check also has a browser or `curl` equivalent.

NEVER

Do not paste a private key or seed phrase into any website or chat. Every step here is signed inside your wallet extension. A site that asks for a key is not part of this guide.

Networks

Network	Chain id	RPC
HyperEVM mainnet	999	`https://rpc.hyperliquid.xyz/evm`
HyperEVM testnet	998	`https://rpc.hyperliquid-testnet.xyz/evm`
Elysium testnet	99801	`https://testnet-rpc.elysium.kinetiq.xyz`

Addresses (verified on-chain on 7 Nov 2026)

What	Network	Address
Native USDC (Circle)	HyperEVM mainnet	`0xb88339CB7199b77E23DB6E890353E22632Ba630f`
CoreDepositWallet	HyperEVM mainnet	`0x6b9e773128f453f5c2c60935ee2de2cbc5390a24`
System address, HyperEVM and HyperCore	both	`0x2222222222222222222222222222222222222222`
Testnet HYPE/USDC spot market	Hyperliquid testnet	`@1035`, HYPE token `0x7317beb7cceed72ef0b346074cc8e7ab`
Elysium bridge inbox	HyperEVM testnet	`0x11178Df40CBf87a4343f4B3F8B09B366ceFA8Ec0`

HOW THE KEY ADDRESS WAS CONFIRMED

The CoreDepositWallet address equals `evmContract.address` for USDC in the `spotMeta` response from `api.hyperliquid.xyz/info`, and the explorer labels it "Circle: Core Deposit Wallet". Its `deposit(uint256,uint32)` function was exercised with a read-only call before any signature.

Steps 1 to 3: mainnet, account, drip

1 Swap a little HYPE for USDC

HYPEREVM MAINNET

DO

1. In Rabby choose the HyperEVM network and open **Swap**.
2. Swap **0.04 HYPE** to **USDC**. The quote was about 3.11 USDC via 1inch, gas under one cent, slippage 1 percent, wallet fee 0.25 percent.
3. Keep roughly 0.05 HYPE for gas.

CHECK

```
# native USDC balance (6 decimals): 3112279 means 3.112279
cast call 0xb88339CB7199b77E23DB6E890353E22632Ba630f \
  "balanceOf(address)(uint256)" YOUR_WALLET --rpc-url https://rpc.hyperliquid.xyz/evm
```

The token must be the native one above. A different "USDC" will not be accepted by step 2.

2 Activate your HyperCore account

HYPEREVM MAINNET

A HyperCore account is created by the **first USDC deposit**. A new account is charged **1 USDC**, so the first deposit must be **more than 1 USDC**. A deposit of 1 USDC or less fails silently. We deposit 3.

DO

1. Open the USDC contract on the explorer, tab **Write as Proxy**, connect the wallet, expand **approve**: `spender = 0x6b9e773128f453f5c2c60935ee2de2cbc5390a24`, `value = 3000000`. Write and confirm.
2. Open the CoreDepositWallet, **Write as Proxy**, expand **deposit**: `amount = 3000000`, `destinationDex = 4294967295`. Leave the "Scale" selector alone. Write and confirm.

> **WHAT THE TWO NUMBERS MEAN**
>
> `3000000` is 3 USDC (6 decimals). `4294967295` is `uint32.max` and sends the funds to the **spot** balance; `0` would send them to the perps balance.

CHECK BEFORE YOU SIGN THE DEPOSIT

```
# allowance must read 3000000
cast call 0xb88339CB7199b77E23DB6E890353E22632Ba630f \
  "allowance(address,address)(uint256)" YOUR_WALLET \
  0x6b9e773128f453f5c2c60935ee2de2cbc5390a24 --rpc-url https://rpc.hyperliquid.xyz/evm

# read-only call of the deposit: an empty 0x reply means it would succeed
cast call 0x6b9e773128f453f5c2c60935ee2de2cbc5390a24 \
  "deposit(uint256,uint32)" 3000000 4294967295 --from YOUR_WALLET \
  --rpc-url https://rpc.hyperliquid.xyz/evm
```

CHECK AFTER

```
curl -s https://api.hyperliquid.xyz/info -H 'content-type: application/json' \
  -d '{"type":"userRole","user":"YOUR_WALLET"}'
# {"role":"user"}     # was {"role":"missing"}
```

Spot should show **2.0 USDC** (3 minus the 1 USDC activation fee). Any HYPE you had sent to `0x2222...2222` earlier moves from escrow into the spot balance.

3 Claim the 1,000 mock USDC

HYPERLIQUID TESTNET

DO

1. Open `app.hyperliquid-testnet.xyz/drip` and connect the **same** wallet.
2. Click the claim button. The drip requires a mainnet deposit from that address, which step 2 provides.
3. If it still says "Already claimed" or stays grey, refresh after a minute and recheck that the role is `user`.

CHECK

```
curl -s https://api.hyperliquid-testnet.xyz/info -H 'content-type: application/json' \
  -d '{"type":"clearinghouseState","user":"YOUR_WALLET"}'
# accountValue 999.0   # 1,000 minus a 1 USDC activation fee
```

> **WHERE IT LANDS**
> The USDC arrives in the **perps** account. It must be on the **spot** side to buy HYPE (step 4).

Steps 4 to 5: buy HYPE and move it

4 Move USDC to spot and buy HYPE

HYPERLIQUID TESTNET

DO

1. **Portfolio, Perps / Spot**: direction Perps to Spot, move the amount you want to spend. The app may later show a combined balance after Enable Trading; that is fine.
2. Open **Trade** and select the **Spot** market **HYPE/USDC** (a direct link is `/trade/@1035`).
3. Click **Enable Trading** once and sign. It is an approval, no funds move.
4. Choose the **Limit** tab, side **Buy**, enter a price slightly above the best ask and a size in HYPE.

> **DO NOT TRADE THE PERP**
>
> The first page that opens is often the **perp** `HYPE-USDC`: it shows **10x**, **Isolated**, **Buy / Long** and **Sell / Short**. A perp cannot give you HYPE tokens. The spot page shows plain **Buy / Sell**, no leverage, and a token contract ending `e7ab`.

READ THE BOOK FROM THE API, NOT FROM A SCREENSHOT

```
curl -s https://api.hyperliquid-testnet.xyz/info -H 'content-type: application/json' \
  -d '{"type":"l2Book","coin":"@1035"}'
```

WHAT WE SAW

- This market is **not priced like real HYPE**. Asks ran from about $3,200 to $4,100 per HYPE. The minimum order is 0.01 HYPE and the book is thin.
- A cheap level (0.17 HYPE near $3,300) vanished between our look and our click, so a limit at 3,400 sat **unfilled** (open order, funds on hold, no fill).
- We cancelled it and placed a limit at 4,100. It filled at **4,088.5**. A limit price is a ceiling: you never pay more, but you must accept the real ask.
- We bought **0.1 HYPE** and then **0.14 HYPE** (about $409 and $572). Testnet USDC has no other use here, so spending it is free.

CHECK

```
curl -s https://api.hyperliquid-testnet.xyz/info -H 'content-type: application/json' \
  -d '{"type":"spotClearinghouseState","user":"YOUR_WALLET"}'
# HYPE total 0.239832   # after both buys, fees paid in HYPE
```

5 Move HYPE from HyperCore to HyperEVM testnet

HYPERLIQUID TESTNET

DO

1. **Portfolio, EVM / Core**.
2. Direction **Core to EVM**, token **HYPE**, amount a little under your balance (we sent 0.239 of 0.239832).
3. Confirm. Use this **or** a spot Send to `0x2222...2222`, not both.

CHECK

```
cast balance YOUR_WALLET --rpc-url https://rpc.hyperliquid-testnet.xyz/evm --ether
# 0.2391
```

7

Steps 6 to 7: bridge and fund the deployer

6 Bridge to Elysium testnet

HYPEREVM TESTNET TO ELYSIUM

DO

1. Open `elysium.kinetiq.xyz/testnet-bridge` and connect the same wallet on **HyperEVM testnet**.
2. Direction **HyperEVM Testnet to Elysium Testnet**. We sent **0.2341 HYPE** and kept about 0.005 HYPE on HyperEVM for gas.
3. Check in the wallet prompt that the destination is Elysium Testnet.

> **WHERE IT LANDS**
>
> The bridge credits **the sending address** on Elysium, not a deploy wallet. Our transaction went to the bridge inbox with `input 0x439370b1`, the Arbitrum Orbit `depositEth()` call, and arrived in about one minute.

CHECK

```
cast balance YOUR_WALLET --rpc-url https://testnet-rpc.elysium.kinetiq.xyz --ether
# 0.2341
```

7 Send it to the deploy wallet

ELYSIUM TESTNET

DO

1. In the wallet, switch to **Elysium Testnet** (chain 99801).
2. Send about **0.2 HYPE** from `YOUR_WALLET` to `DEPLOYER`.
3. Confirm that the network line in the wallet prompt says Elysium Testnet, not HyperEVM.

CHECK

```
cast balance DEPLOYER --rpc-url https://testnet-rpc.elysium.kinetiq.xyz --ether
# about 0.2
```

With that balance the 15-contract deploy (estimated at 0.0126 HYPE) and the rehearsal steps after it have plenty of room.

8

Pitfalls and troubleshooting

Symptom	Cause and fix
HYPE sent to `0x2222...2222` but the HyperCore balance is empty and role is `missing`	The account does not exist yet. The HYPE is held under `evmEscrows`. Activate the account with step 2 and the escrow is released into spot. No fund is lost.
The drip button says "Already claimed" or is grey	Trust the API, not the label. Check `userRole` (must be `user`), then `clearinghouseState`. Refresh after a minute.
Trade page shows Long / Short and 10x	That is the perp. Use the Spot tab of the market selector, or open `/trade/@1035`.
Limit order did not fill	The ask moved. Read `l2Book` again and place a new limit above the current best ask. Cancel the old one from Open Orders so funds are released.
Order Value looks much bigger than expected	It shows the ceiling (price x size), not the fill. The fill happens at the best ask.
Deposit to a new account of 1 USDC or less	Fails silently. Deposit more than 1 USDC.
Balance reads `20.0000` and looks like twenty thousand	A dot is a decimal point. It is twenty.
"You're sending to a contract, funds may be lost" in the wallet	Expected for the system address and the bridge inbox. Keep the amount small the first time.
Bridge arrived but the deployer shows 0	The bridge pays the sending wallet. Do step 7.
Wallet says insufficient gas on HyperEVM testnet	Keep a few thousandths of HYPE there. The system address and bridge calls need gas.
Chat or site says a faucet is "empty" but you pass its checks	Not your fault. Try later or use this route.

> **IF A FAUCET RULE CHANGES**
> Faucet policies change often. Re-check each address on-chain and each rule on the faucet's own page before relying on this guide a second time.

9

Final state, safety, glossary

Where the funds ended up

Place	Amount
Elysium testnet, funded wallet	0.2341 HYPE (before the send to the deploy wallet)

Place	Amount
HyperEVM testnet, funded wallet	about 0.005 HYPE
HyperCore testnet spot	about 17 USDC and 0.0008 HYPE
HyperCore mainnet spot	about 2 USDC and 0.01 HYPE

The mainnet leftovers can go back to HyperEVM with **Transfer to EVM** on `app.hyperliquid.xyz` whenever you want them.

Safety rules

- One wallet, signed only inside your wallet extension. No private key goes to any site.
- Check the destination network and address in every wallet prompt before confirming.
- Start small the first time you touch a system address. Verify the result with the API before repeating.
- Do not treat testnet prices as real prices.

API cheat sheet

Question	Request body for `POST /info`
Is the account active?	`{"type":"userRole","user":"ADDR"}`
Spot balances and escrow	`{"type":"spotClearinghouseState","user":"ADDR"}`
Perps balance	`{"type":"clearinghouseState","user":"ADDR"}`
Open orders	`{"type":"openOrders","user":"ADDR"}`
Fills	`{"type":"userFills","user":"ADDR"}`
Order book of the spot market	`{"type":"l2Book","coin":"@1035"}`
Deposits and transfers	`{"type":"userNonFundingLedgerUpdates","user":"ADDR","startTime":0}`

Mainnet host `https://api.hyperliquid.xyz/info`, testnet host `https://api.hyperliquid-testnet.xyz/info`.

Glossary

Term	Meaning
HyperEVM	The EVM side of Hyperliquid. Chain 999 (mainnet) and 998 (testnet). Gas is HYPE.
HyperCore	The trading side: perps and spot order books, with its own accounts.
Escrow	Funds held for an address whose HyperCore account does not exist yet. Released on activation.
CoreDepositWallet	Circle's contract that moves native USDC from HyperEVM into a HyperCore account.
Perp vs spot	A perp is a leveraged bet on a price and gives no token. Spot trades the real token.

Prepared by **Asif** for the BELL project, 7 November 2026. Testnet only. No keys or credentials appear in this document.
